

1. What are functions in Python?

Functions are reusable blocks of code that perform a specific task. They are created using the `def` keyword.

2. What is the difference between `*args` and `**kwargs`?

`*args` accepts multiple positional arguments, while `**kwargs` accepts multiple keyword arguments.

3. Explain list comprehensions.

List comprehension creates a list in a single line. Example: `[x*x for x in range(5)]`.

4. What are lambda functions?

Lambda functions are anonymous, single-line functions. They are used for simple operations.

5. What are decorators?

Decorators add or modify a function's behavior. They are applied using the `@` symbol.
