

1. What is the difference between a compiler and an interpreter?

Answer: A compiler translates the entire program. An interpreter executes it line by line.

2. What are Python keywords?

Answer: Keywords are reserved words. They cannot be used as variable names.

3. What is the difference between input() and print()?

Answer: input() takes input. print() displays output.

4. What are Python operators?

Answer: Operators perform operations on data. Examples: +, -, ==, and.

5. What is type casting in Python?

Answer: Type casting converts one data type to another. Example: int(), float(), str().
