

1. What are generators?

Generators produce values one at a time using yield. They are memory-efficient.

2. Difference between yield and return?

return ends the function, while yield pauses it and returns values one by one.

3. What are iterators and iterables?

An iterable can be looped over, while an iterator returns one element at a time.

4. What is exception handling?

It handles runtime errors using try, except, else, and finally without crashing the program.

5. What is the purpose of the with statement?

The with statement manages resources automatically. It safely closes files after use.
